1、IELTS Writing Task 1: 'waste chart' answer

The chart below compares levels of recycling, as well as some less environmentally friendly forms of waste management, in fifteen European countries.

The bar chart shows the percentage of waste that is recycled, put into landfill or incinerated in various EU countries.

If we look at the fifteen EU countries as a whole, it is clear that more waste goes to landfill sites than to any other refuse management facility. In fact, while around half of the countries put the majority of their waste into landfill sites, only two countries recycle at least 50% of the waste that they produce.

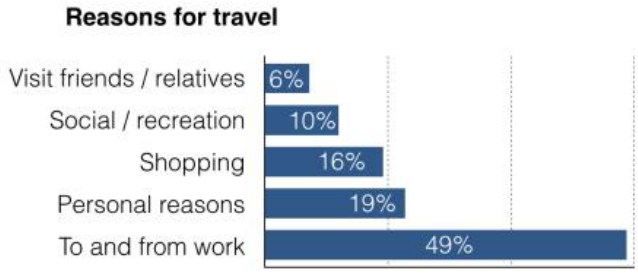

Austria and Belgium are the most environmentally friendly of the fifteen countries, recycling around 60% and 50% of their waste respectively. Germany, Sweden and Belgium also appear to have effective recycling programmes, resulting in roughly 40% of waste being processed in this way in each country.

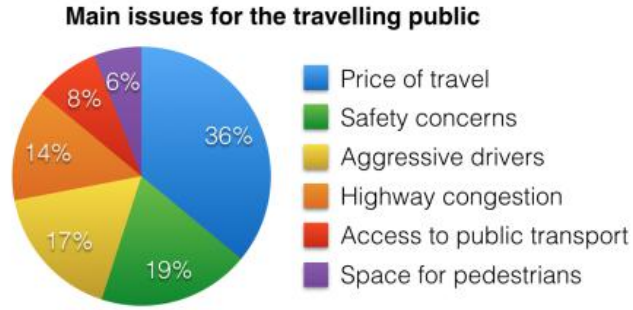

Other EU countries recycle far less. Greece, Ireland and the UK, for example, only recycle around 10% of refuse, and put between 80 and 90 per cent of their waste into landfill. Finally, while most non-recycled waste in the EU area goes to landfill, four countries, namely Luxembourg, Sweden, the Netherlands and Denmark, incinerate more waste than they bury.

(184 words, band 9)

2、IELTS Writing Task 1: two charts answer

The charts below show reasons for travel and the main issues for the travelling public in the US in 2009.

The bar chart and pie chart give information about why US residents travelled and what travel problems they experienced in the year 2009.

It is clear that the principal reason why Americans travelled in 2009 was to commute to and from work. In the same year, the primary concern of Americans, with regard to the trips they made, was the cost of travelling.

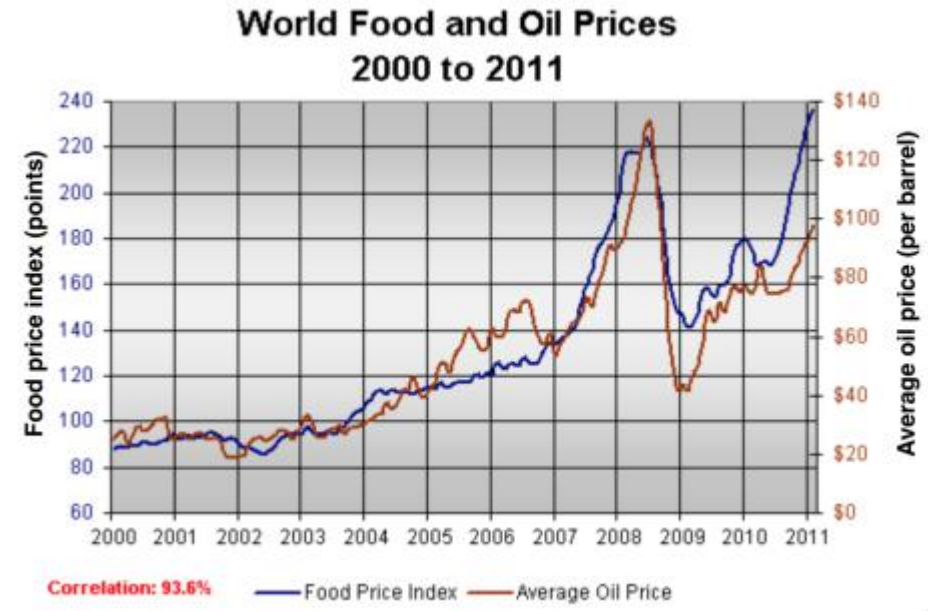

Looking more closely at the bar chart, we can see that 49% of the trips made by Americans in 2009 were for the purpose of commuting. By contrast, only 6% of trips were visits to friends or relatives, and one in ten trips were for social or recreation reasons. Shopping was cited as the reason for 16% of all travel, while unspecific 'personal reasons' accounted for the remaining 19%.

According to the pie chart, price was the key consideration for 36% of American travellers. Almost one in five people cited safety as their foremost travel concern, while aggressive driving and highway congestion were the main issues for 17% and 14% of the travelling public. Finally, a total of 14% of those surveyed thought that access to public transport or space for pedestrians were the most important travel issues.

(201 words, band 9)

3、IELTS Writing Task 1: line graph answer

The graph below shows changes in global food and oil prices between 2000 and 2011.

The line graph compares the average price of a barrel of oil with the food price index over a period of 11 years.

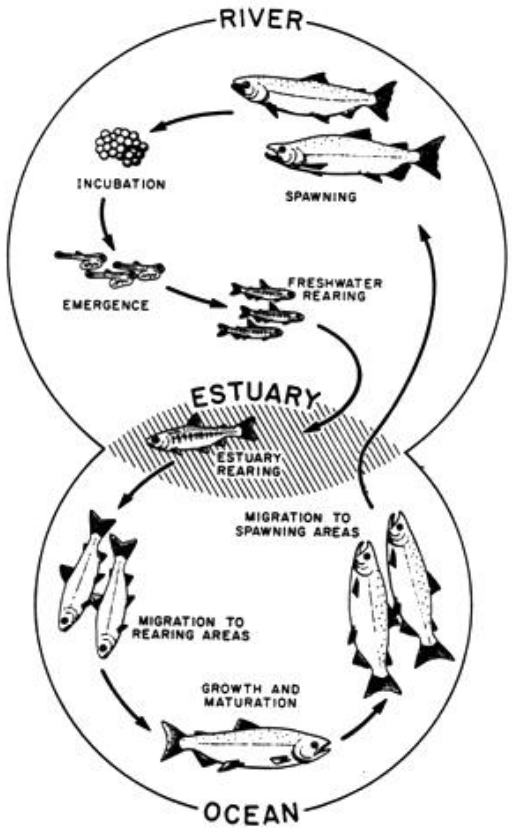

It is clear that average global prices of both oil and food rose considerably between 2000 and 2011. Furthermore, the trends for both commodities were very similar, and so a strong correlation (93.6%) is suggested.

In the year 2000, the average global oil price was close to $25 per barrel, and the food price index stood at just under 90 points. Over the following four years both prices remained relatively stable, before rising steadily between 2004 and 2007. By 2007, the average oil price had more than doubled, to nearly $60 per barrel, and food prices had risen by around 50 points.

A dramatic increase in both commodity prices was seen from 2007 to 2008, with oil prices reaching a peak of approximately $130 per barrel and the food price index rising to 220 points. However, by the beginning of 2009 the price of oil had dropped by roughly $90, and the food price index was down by about 80 points. Finally, in 2011, the average oil price rose once again, to nearly $100 per barrel, while the food price index reached its peak, at almost 240 points.

4、IELTS Writing Task 1: life cycle answer

The diagram below shows the life cycle of a salmon, from egg to adult fish.

The diagram illustrates the stages in the life of the salmon, from birth to maturity.

It is clear that there are six* main stages as the salmon develops from egg to mature adult. We can also see that salmon spend time in three distinct locations during the cycle, moving from river to estuary to ocean and then back upstream.

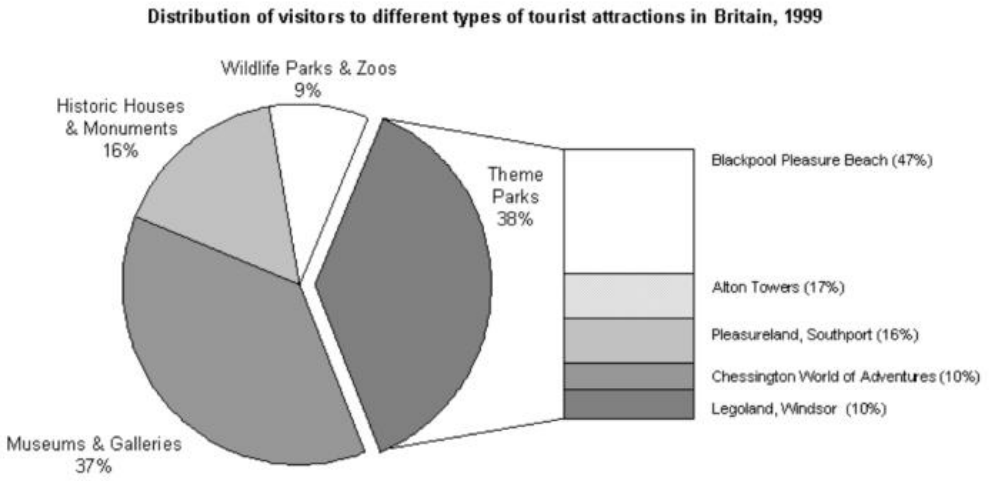

Salmon begin their lives in rivers where the adult fish lay and incubate their eggs. After emerging from eggs, the young salmon spend the next stage of their lives being reared in freshwater areas. Then, at some point in their development, the fish swim downstream to river estuaries where rearing continues.

Following the estuary rearing period, the maturing salmon migrate to the ocean, where they eventually become fully grown adults. Finally, the adult fish travel back upstream to spawning areas of rivers; here they reproduce and lay their eggs, and the life cycle begins anew.

(154 words, band 9)

5、IELTS Writing Task 1: pie chart answer

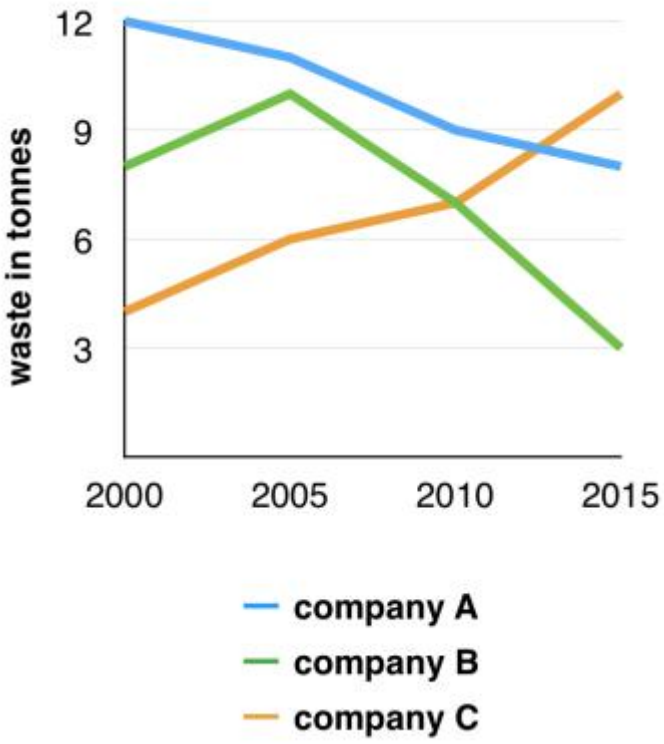

The chart below shows the results of a survey of people who visited four types of tourist attraction in Britain in the year 1999.

The pie chart compares figures for visitors to four categories of tourist attraction and to five different theme parks in Britain in 1999.
It is clear that theme parks and museums / galleries were the two most popular types of tourist attraction in that year. Blackpool Pleasure Beach received by far the highest proportion of visitors in the theme park sector.
Looking at the information in more detail, we can see that 38% of the surveyed visitors went to a theme park, and 37% of them went to a museum or gallery. By contrast, historic houses and monuments were visited by only 16% of the sample, while wildlife parks and zoos were the least popular of the four types of tourist attraction, with only 9% of visitors.
In the theme park sector, almost half of the people surveyed (47%) had been to Blackpool Pleasure Beach. Alton Towers was the second most popular amusement park, with 17% of the sample, followed by Pleasureland in Southport, with 16%. Finally, Chessington World of Adventures and Legoland Windsor had each welcomed 10% of the surveyed visitors.
(181 words, band 9)

6、IELTS Writing Task 1: 'waste graph' answer

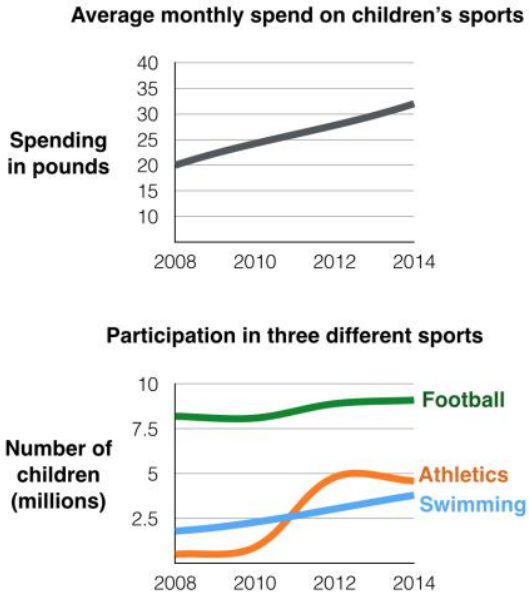

The graph below shows the amounts of waste produced by three companies over a period of 15 years.

The line graph compares three companies in terms of their waste output between the years 2000 and 2015.
It is clear that there were significant changes in the amounts of waste produced by all three companies shown on the graph. While companies A and B saw waste output fall over the 15-year period, the amount of waste produced by company C increased considerably.
In 2000, company A produced 12 tonnes of waste, while companies B and C produced around 8 tonnes and 4 tonnes of waste material respectively. Over the following 5 years, the waste output of companies B and C rose by around 2 tonnes, but the figure for company A fell by approximately 1 tonne.
From 2005 to 2015, company A cut waste production by roughly 3 tonnes, and company B reduced its waste by around 7 tonnes. By contrast, company C saw an increase in waste production of approximately 4 tonnes over the same 10-year period. By 2015, company C's waste output had risen to 10 tonnes, while the respective amounts of waste from companies A and B had dropped to 8 tonnes and only 3 tonnes.
(192 words, band 9)

7、IELTS Writing Task 1: separate line graphs answer

The first chart below gives information about the money spent by British parents on their children's sports between 2008 and 2014. The second chart shows the number of children who participated in three sports in Britain over the same time period.

The line graphs show the average monthly amount that parents in Britain spent on their children's sporting activities and the number of British children who took part in three different sports from 2008 to 2014.

It is clear that parents spent more money each year on their children's participation in sports over the six-year period. In terms of the number of children taking part, football was significantly more popular than athletics and swimming.

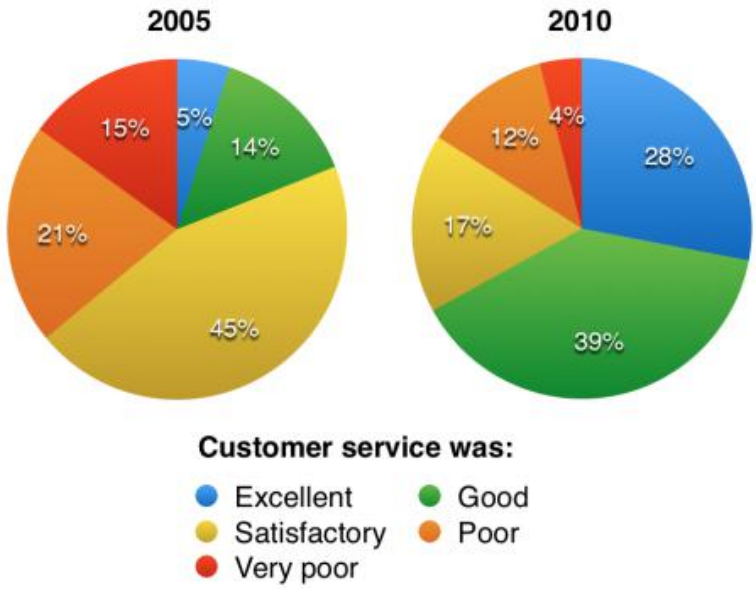

In 2008, British parents spent an average of around £20 per month on their children's sporting activities. Parents' spending on children's sports increased gradually over the following six years, and by 2014 the average monthly amount had risen to just over £30.

Looking at participation numbers, in 2008 approximately 8 million British children played football, while only 2 million children were enrolled in swimming clubs and less than 1 million practised athletics. The figures for football participation remained relatively stable over the following 6 years. By contrast, participation in swimming almost doubled, to nearly 4 million children, and there was a near fivefold increase in the number of children doing athletics.

(185 words, band 9)

8、IELTS Writing Task 1: pie charts report

The charts below show the results of a questionnaire that asked visitors to the Parkway Hotel how they rated the hotel's customer service. The same questionnaire was given to 100 guests in the years 2005 and 2010.

The pie charts compare visitors' responses to a survey about customer service at the Parkway Hotel in 2005 and in 2010.

It is clear that overall customer satisfaction increased considerably from 2005 to 2010. While most hotel guests rated customer service as satisfactory or poor in 2005, a clear majority described the hotel's service as good or excellent in 2010.

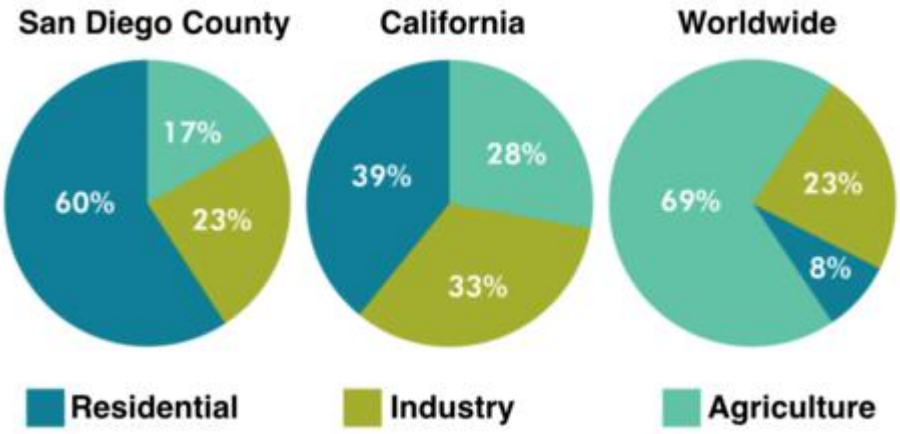

Looking at the positive responses first, in 2005 only 5% of the hotel's visitors rated its customer service as excellent, but this figure rose to 28% in 2010. Furthermore, while only 14% of guests described customer service in the hotel as good in 2005, almost three times as many people gave this rating five years later.

With regard to negative feedback, the proportion of guests who considered the hotel's customer service to be poor fell from 21% in 2005 to only 12% in 2010. Similarly, the proportion of people who thought customer service was very poor dropped from 15% to only 4% over the 5-year period. Finally, a fall in the number of 'satisfactory' ratings in 2010 reflects the fact that more people gave positive responses to the survey in that year.

(193 words, band 9)

9、IELTS Writing Task 1: pie charts answer

The pie charts below compare water usage in San Diego, California and the rest of the world.

The pie charts give information about the water used for residential, industrial and agricultural purposes in San Diego County, California, and the world as a whole.

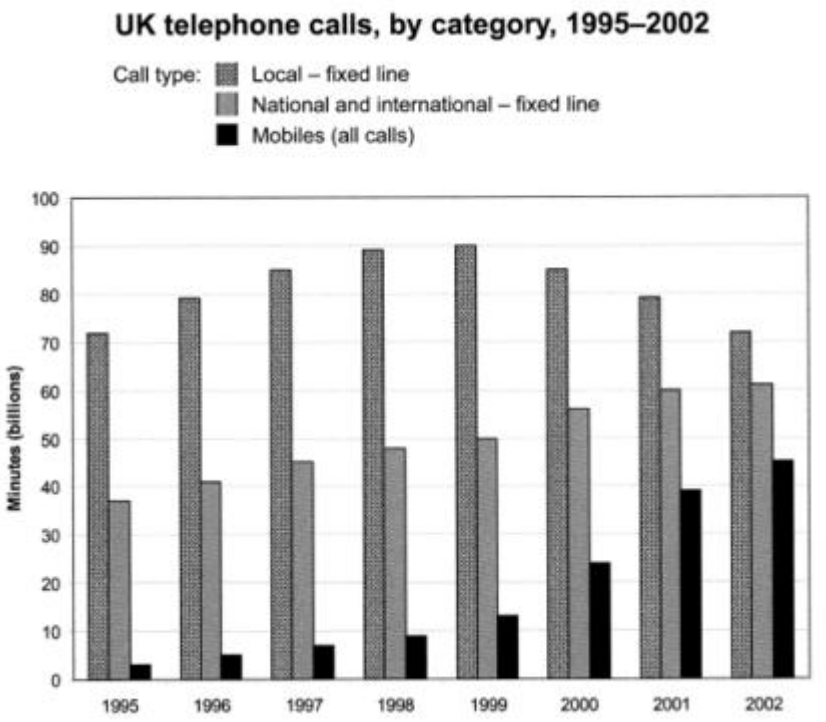

It is noticeable that more water is consumed by homes than by industry or agriculture in the two American regions. By contrast, agriculture accounts for the vast majority of water used worldwide.

In San Diego County and California State, residential water consumption accounts for 60% and 39% of total water usage. By contrast, a mere 8% of the water used globally goes to homes. The opposite trend can be seen when we look at water consumption for agriculture. This accounts for a massive 69% of global water use, but only 17% and 28% of water usage in San Diego and California respectively.

Such dramatic differences are not seen when we compare the figures for industrial water use. The same proportion of water (23%) is used by industry in San Diego and worldwide, while the figure for California is 10% higher, at 33%. (168 words, band 9)

10、IELTS Writing Task 1: 'phone calls' bar chart

The chart below shows the total number of minutes (in billions) of telephone calls in the UK, divided into three categories, from 1995-2002.

The bar chart compares the amount of time spent by people in the UK on three different types of phone call between 1995 and 2002.

It is clear that calls made via local, fixed lines were the most popular type, in terms of overall usage, throughout the period shown. The lowest figures on the chart are for mobile calls, but this category also saw the most dramatic increase in user minutes.

In 1995, people in the UK used fixed lines for a total of just over 70 billion minutes for local calls, and about half of that amount of time for national or international calls. By contrast, mobile phones were only used for around 4 billion minutes. Over the following four years, the figures for all three types of phone call increased steadily.

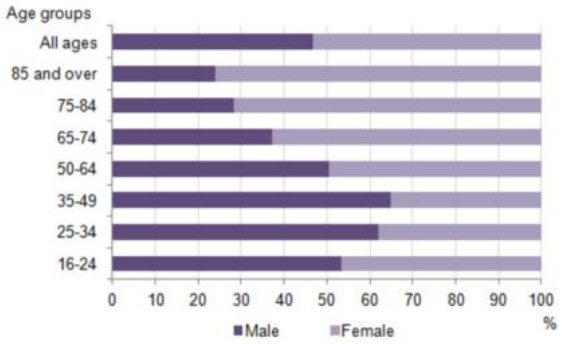

By 1999, the amount of time spent on local calls using landlines had reached a peak at 90 billion minutes. Subsequently, the figure for this category fell, but the rise in the other two types of phone call continued. In 2002, the number of minutes of national / international landline calls passed 60 billion, while the figure for mobiles rose to around 45 billion minutes.

(197 words, band 9)

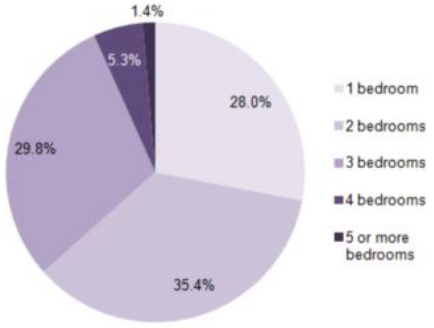

11、IELTS Writing Task 1: 'living alone' charts

The bar chart below shows the proportions of English men and women of different ages who were living alone in 2011. The pie chart compares the numbers of bedrooms in these one-person households.

Living alone in England by age and gender, 2011

Number of bedrooms in one-person households (England, 2011)

The two charts give information about single-occupant households in England in the year 2011. The bar chart compares figures for occupants' age and gender, and the pie chart shows data about the number of bedrooms in these homes.

Overall, females made up a higher proportion of people living alone than males, and this difference is particularly noticeable in the older age categories. We can also see that the most common number of bedrooms in a single-occupant home was two.

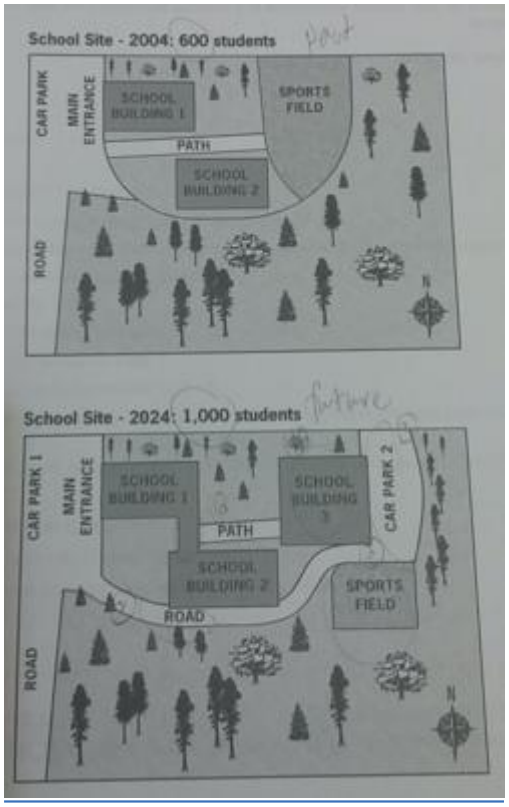

A significant majority of the people aged 65 or over who were living alone in England in 2011 were female. Women made up around 72% of single occupants aged 75 to 84, and 76% of those aged 85 or over. By contrast, among younger adults the figures for males were higher. For example, in the 35-49 age category, men accounted for nearly 65% of people living alone.

In the same year, 35.4% of one-person households in England had two bedrooms, while one-bedroom and three-bedroom homes accounted for 28% and 29.8% of the total. Under 7% of single-occupant homes had four or more bedrooms.

(189 words, band 9)

12、IELTS Writing Task 1: 'school buildings' answer

The diagrams below show the site of a school in 2004 and the plan for changes to the school site in 2024.

(Source: Official IELTS Practice Materials 2)

The two pictures compare the layout of a school as it was in the year 2004 with a proposed site design for the year 2024.

It is clear that the main change for 2024 involves the addition of a new school building. The school will then be able to accommodate a considerably larger number of students.

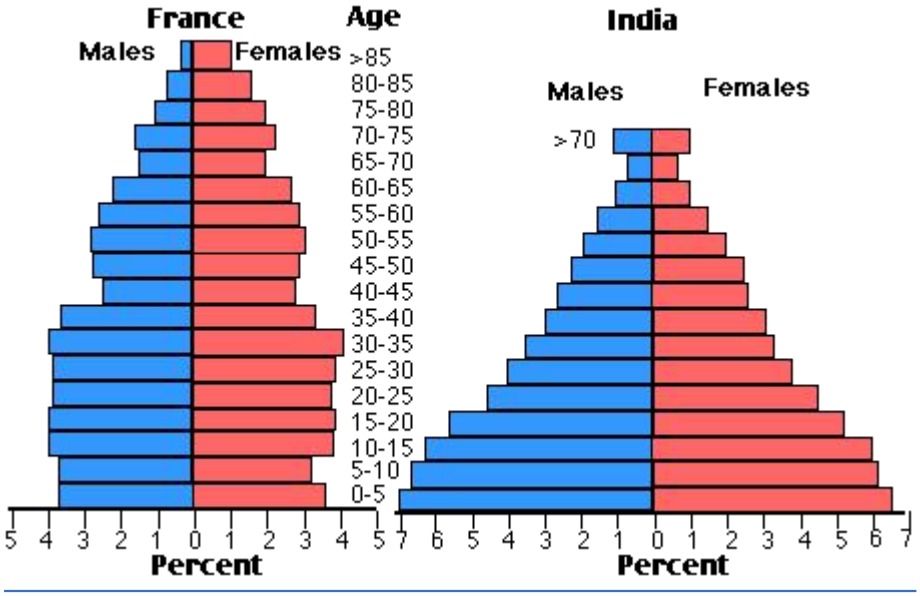

In 2004, there were 600 pupils attending the school, and the two school buildings were separated by a path running from the main entrance to the sports field. By 2024, it is expected that there will be 1000 pupils, and a third building will have been constructed. Furthermore, the plan is to join the two original buildings together, creating a shorter path that links the buildings only.

As the third building and a second car park will be built on the site of the original sports field, a new, smaller sports field will need to be laid. A new road will also be built from the main entrance to the second car park. Finally, no changes will be made to the main entrance and original car park.

(183 words, band 9)

13、IELTS Writing Task 1: 'age distribution' answer

The charts below compare the age structure of the populations of France and India in 1984.

The two charts compare the populations of France and India in terms of age distribution by gender in the year 1984.

It is clear that the population of India was younger than that of France in 1984, with a noticeably larger proportion of people aged under 20. France, on the other hand, had a significantly larger percentage of elderly inhabitants.

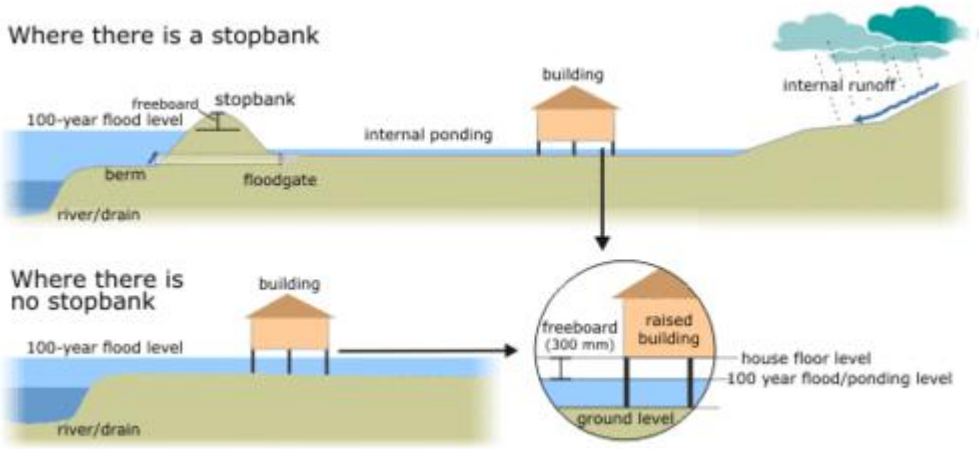

In India, close to 14% of people were aged 5 or under, and each five-year age bracket above this contained an increasingly smaller proportion of the population. France's population, by contrast, was more evenly distributed across the age ranges, with similar figures (around 7% to 8% of all people) for each five-year cohort between the ages of 0 and 40. Somewhere between 10% and 15% of all French people were aged 70 or older, but the equivalent figure for India was only 2%.

Looking more closely at gender, there was a noticeably higher proportion of French women than men in every cohort from age 50 upwards. For example, almost 3% of French 70- to 75-year-olds were women, while just under 2% were men. No significant gender differences can be seen on the Indian population chart.

(199 words, band 9)

14、IELTS Writing Task 1: analyse sample answers

The diagrams below show how houses can be protected in areas which are prone to flooding.

The diagrams compare two different methods of defence for homes which are at risk of being flooded.

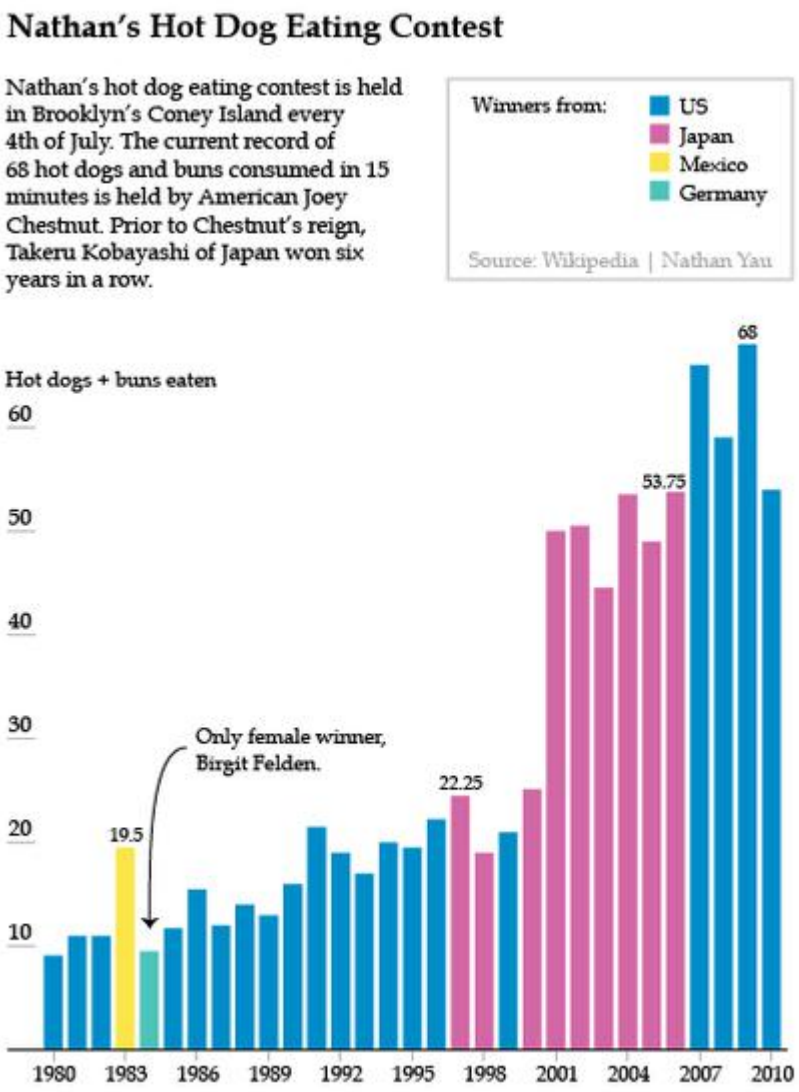

The key difference between the diagrams is that they show flood protection with and without a stopbank. In either case, the at-risk home is raised on stilts above ground level.

The first diagram shows how a stopbank acts as a flood barrier to stop river water from flooding homes. The stopbank is a small mound of land next to the river that is higher than the 100-year flood level, and prevents the river from bursting its banks. Nearby houses can be built on stilts to prevent flooding from rainwater, and a floodgate beneath the stopbank can be opened to allow this 'ponding' to drain off into the river.

When there is no stopbank, as shown in the second diagram, there will be nothing to stop the river from flooding. In this case, the solution is to put buildings on stilts. The height of the stilts is measured so that the floor of the house is 300mm above the 100-year flood level. This measurement is called the 'freeboard'.

15、IELTS Writing Task 1: 'hot dog' bar chart

I enjoyed writing today's report about the chart below!

Note: I've underlined some good phrases.

The bar chart shows the number of hot dogs and buns eaten in 15 minutes by the winners of 'Nathan's Hot Dog Eating Contest' in Brooklyn, USA between 1980 and 2010.

It is noticeable that the number of hot dogs and buns eaten by winners of the contest increased dramatically over the period shown. The majority of winners were American or Japanese, and only one woman had ever won the contest.

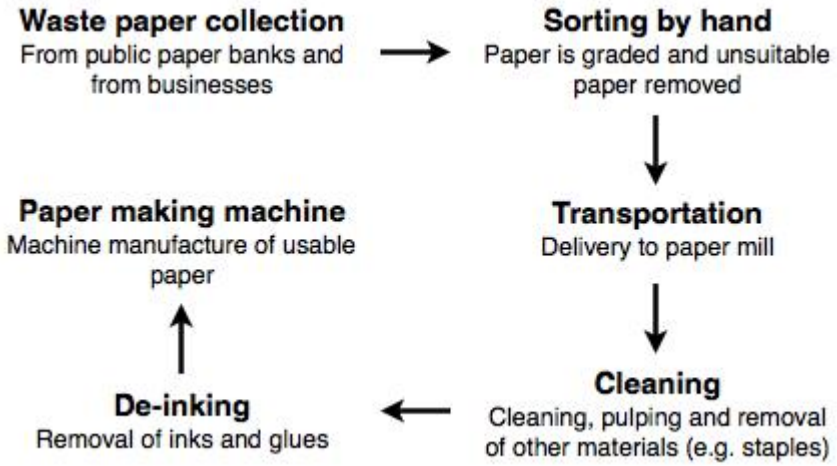

Americans dominated the contest from 1980 to 1996, and the winning number of hot dogs and buns consumed rose from only 8 to around 21 during that time. 1983 and 1984 were notable exceptions to the trend for American winners. In 1983 a Mexican won the contest after eating 19.5 hot dogs, almost double the amount that any previous winner had eaten, and 1984 saw the only female winner, Birgit Felden from Germany.

A Japanese contestant, Takeru Kobayashi, reigned as hot dog eating champion for six years from 2001 to 2006. Kobayashi's winning totals of around 50 hot dogs were roughly double the amount that any previous winner had managed. However, the current champion, American Joey Chestnut, took

hot dog eating to new heights in 2009 when he consumed an incredible 68 hot dogs and buns in the allotted 15 minutes.

16、IELTS Writing Task 1: flow chart essay

The chart below shows the process of waste paper recycling.

The flow chart shows how waste paper is recycled. It is clear that there are six distinct stages in this process, from the initial collection of waste paper to the eventual production of usable paper.

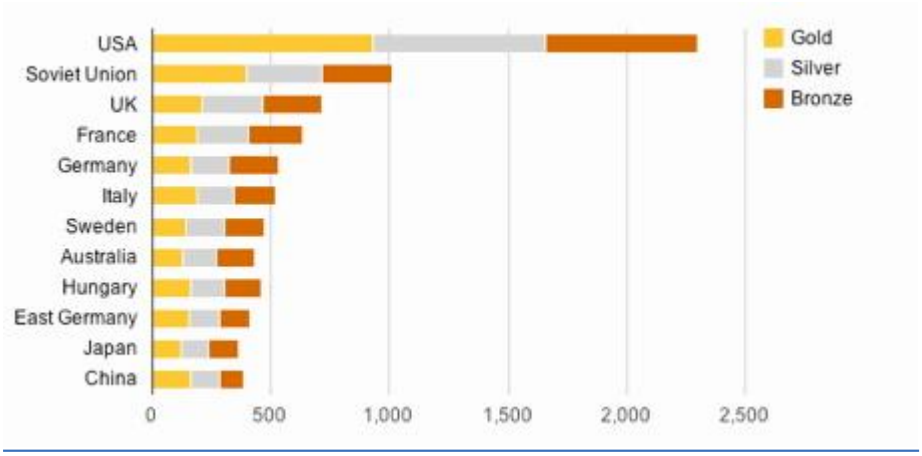

At the first stage in the paper recycling process, waste paper is collected either from paper banks, where members of the public leave their used paper, or directly from businesses. This paper is then sorted by hand and separated according to its grade, with any paper that is not suitable for recycling being removed. Next, the graded paper is transported to a paper mill.

Stages four and five of the process both involve cleaning. The paper is cleaned and pulped, and foreign objects such as staples are taken out. Following this, all remnants of ink and glue are removed from the paper at the de-inking stage. Finally, the pulp can be processed in a paper making machine, which makes the end product: usable paper.

(160 words, band 9)

17、IELTS Writing Task 1: stacked bar chart essay

The chart below shows the total number of Olympic medals won by twelve different countries.

The bar chart compares twelve countries in terms of the overall number of medals that they have won at the Olympic Games.

It is clear that the USA is by far the most successful Olympic medal winning nation. It is also noticeable that the figures for gold, silver and bronze medals won by any particular country tend to be fairly similar.

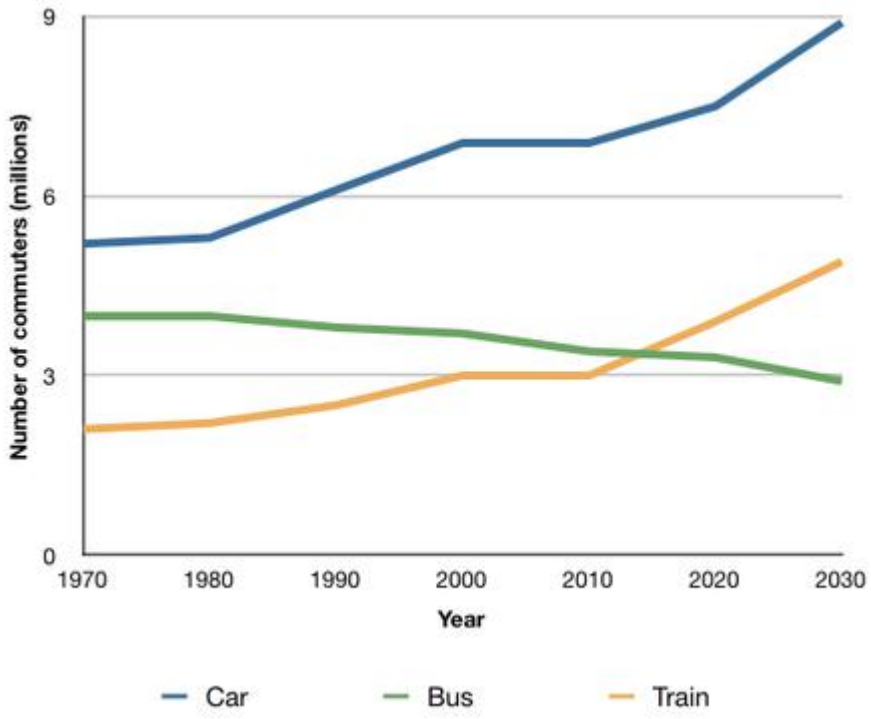

The USA has won a total of around 2,300 Olympic medals, including approximately 900 gold medals, 750 silver and 650 bronze. In second place on the all-time medals chart is the Soviet Union, with just over 1,000 medals. Again, the number of gold medals won by this country is slightly higher than the number of silver or bronze medals.

Only four other countries - the UK, France, Germany and Italy - have won more than 500 Olympic medals, all with similar proportions of each medal colour. Apart from the USA and the Soviet Union, China is the only other country with a noticeably higher proportion of gold medals (about 200) compared to silver and bronze (about 100 each).

(178 words, band 9)

18、IELTS Writing Task 1: full essay

The graph below shows the average number of UK commuters travelling each day by car, bus or train between 1970 and 2030.

The line graph compares figures for daily travel by workers in the UK using three different forms of transport over a period of 60 years.

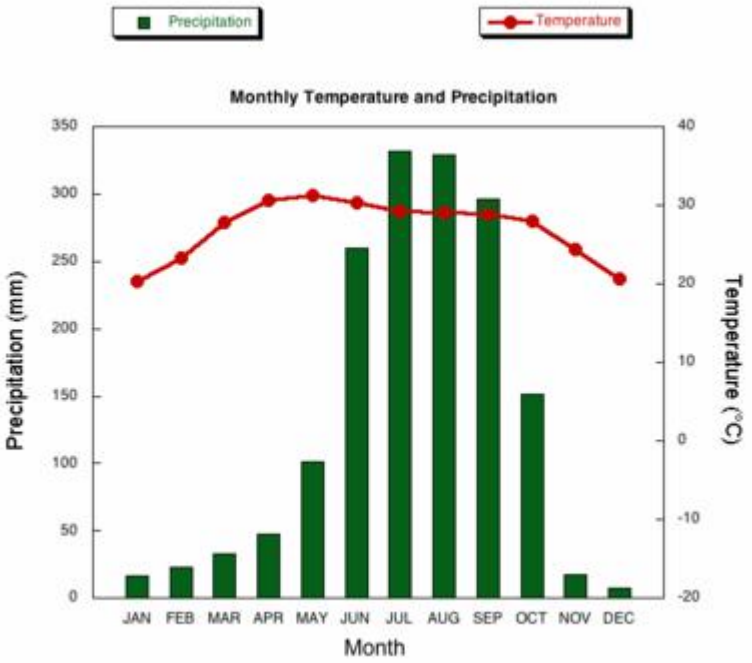

It is clear that the car is by far the most popular means of transport for UK commuters throughout the period shown. Also, while the numbers of people who use the car and train increase gradually, the number of bus users falls steadily.

In 1970, around 5 million UK commuters travelled by car on a daily basis, while the bus and train were used by about 4 million and 2 million people respectively. In the year 2000, the number of those driving to work rose to 7 million and the number of commuting rail passengers reached 3 million. However, there was a small drop of approximately 0.5 million in the number of bus users.

By 2030, the number of people who commute by car is expected to reach almost 9 million, and the number of train users is also predicted to rise, to nearly 5 million. By contrast, buses are predicted to become a less popular choice, with only 3 million daily users.

19、IELTS Writing Task 1: climate essay

The climograph below shows average monthly temperatures and rainfall in the city of Kolkata.

The chart compares average figures for temperature and precipitation over the course of a calendar year in Kolkata.

It is noticeable that monthly figures for precipitation in Kolkata vary considerably, whereas monthly temperatures remain relatively stable. Rainfall is highest from July to August, while temperatures are highest in April and May.

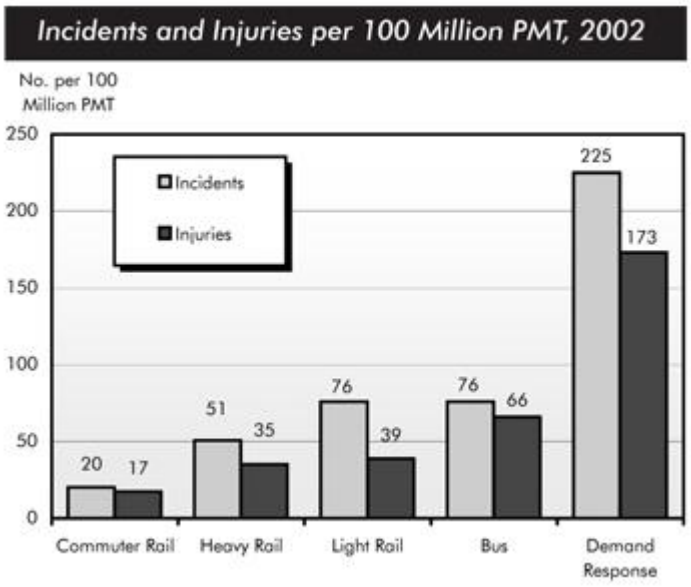

Between the months of January and May, average temperatures in Kolkata rise from their lowest point at around 20°C to a peak of just over 30°C. Average rainfall in the city also rises over the same period, from approximately 20mm of rain in January to 100mm in May.

While temperatures stay roughly the same for the next four months, the amount of rainfall more than doubles between May and June. Figures for precipitation remain above 250mm from June to September, peaking at around 330mm in July. The final three months of the year see a dramatic fall in precipitation, to a low of about 10mm in December, and a steady drop in temperatures back to the January average.

(173 words, band 9)

20、IELTS Writing Task 1: 'chart without years' essay

The chart below shows numbers of incidents and injuries per 100 million passenger miles travelled (PMT) by transportation type in 2002.

The bar chart compares the number of incidents and injuries for every 100 million passenger miles travelled on five different types of public transport in 2002.

It is clear that the most incidents and injuries took place on demand-response vehicles. By contrast, commuter rail services recorded by far the lowest figures.

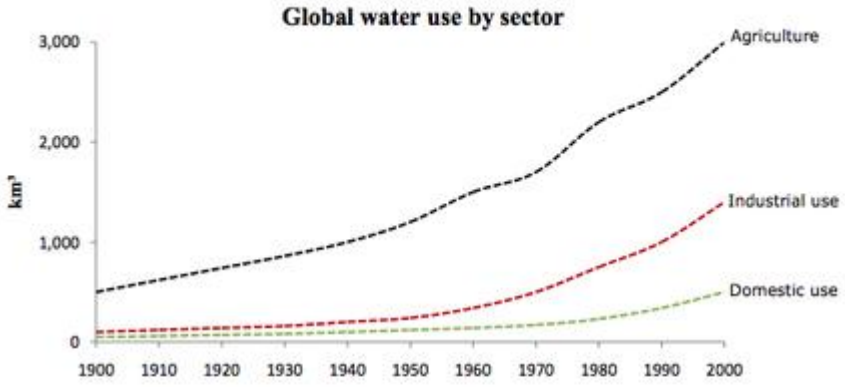

A total of 225 incidents and 173 injuries, per 100 million passenger miles travelled, took place on demand-response transport services. These figures were nearly three times as high as those for the second highest category, bus services. There were 76 incidents and 66 people were injured on buses.

Rail services experienced fewer problems. The number of incidents on light rail trains equalled the figure recorded for buses, but there were significantly fewer injuries, at only 39. Heavy rail services saw lower numbers of such events than light rail services, but commuter rail passengers were even less likely to experience problems. In fact, only 20 incidents and 17 injuries occurred on commuter trains.

(165 words, band 9)

21、IELTS Writing Task 1: graph and table essay

The graph and table below give information about water use worldwide and water consumption in two different countries.

Water consumption in Brazil and Congo in 2000

Country	Population	Irrigated land	Water consumption per person
Brazil	176 million	26,500 km²	359 m³
Democratic Republic of Congo	5.2 million	100 km²	8 m³

The charts compare the amount of water used for agriculture, industry and homes around the world, and water use in Brazil and the Democratic Republic of Congo.

It is clear that global water needs rose significantly between 1900 and 2000, and that agriculture accounted for the largest proportion of water used. We can also see that water consumption was considerably higher in Brazil than in the Congo.

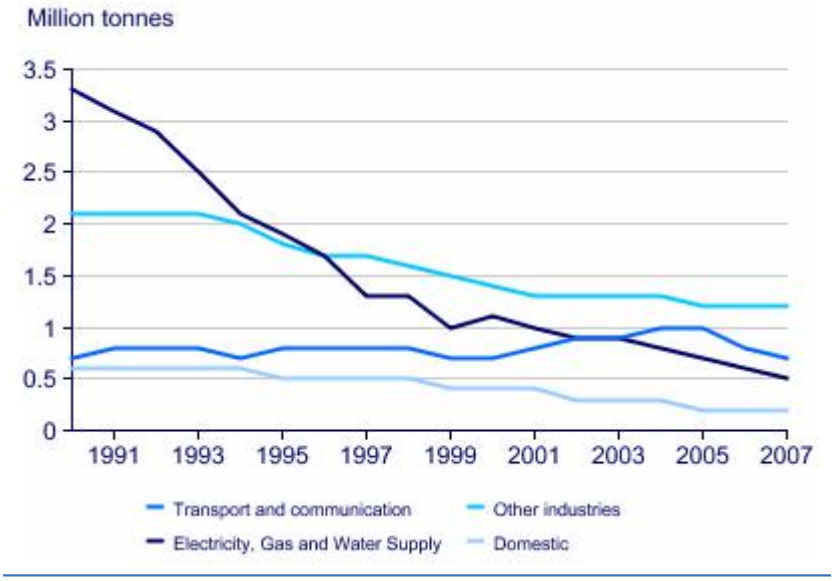

In 1900, around 500km 鲁 of water was used by the agriculture sector worldwide. The figures for industrial and domestic water consumption stood at around one fifth of that amount. By 2000, global water use for agriculture had increased to around 3000km, industrial water use had risen to just under half that amount, and domestic consumption had reached approximately 500km.

In the year 2000, the populations of Brazil and the Congo were 176 million and 5.2 million respectively. Water consumption per person in Brazil, at 359m, was much higher than that in the Congo, at only 8m, and this could be explained by the fact that Brazil had 265 times more irrigated land.

(184 words, band 9)

22、IELTS Writing Task 1: line graph exercise

The graph below shows UK acid rain emissions, measured in millions of tonnes, from four different sectors between 1990 and 2007.

I've made the following essay into a gap-fill exercise.

The line graph compares four sectors in _____ of the amount of acid rain emissions that they produced over a period of 17 years in the UK.

It is clear that the total amount of acid rain emissions in the UK _____ _____ between 1990 and 2007. The most _____ decrease was seen in the electricity, gas and water supply sector.

In 1990, around 3.3 million tonnes of acid rain emissions came from the electricity, gas and water sector. The transport and communication sector was _____ for about 0.7 million tonnes of emissions, while the domestic sector _____ around 0.6 million tonnes. Just over 2 million tonnes of acid rain gases came from other industries.

Emissions from electricity, gas and water supply fell dramatically to only 0.5 million tonnes in 2007, a _____ of almost 3 million tonnes. While acid rain gases from the domestic sector and other industries fell gradually, the transport sector _____ a small increase in emissions, _____ a peak of 1 million tonnes in 2005.
